GOODRAM releases firmware update for CX300 SSD

Wilk Elektronik SA, a memory manufacturer and owner of the GOODRAM brand, releases a firmware update for the SSD model, CX300.

The firmware update is designed to increase the performance and the lifespan of the CX300 models, those purchased in the recent past as well as those bought a few years ago. The updating application informs the user if the SSD needs to be updated. In case the SSD reports to the application that it contains the latest firmware version, it should not be updated.

In order to run the firmware update the following steps should be taken:

- Plug the drive into the SATA III connector - the update will fail if the drive is connected to the USB port
- Before running the application, make a backup copy of the data stored on the updated SSD. The update itself does not delete data, but if the update process fails, the data may be lost forever
- Unzip and run the file by choosing the appropriate solid state drive
- Click "Upgrade firmware"
- Follow the instructions displayed on the screen

The firmware update is available in the English version in the "Download" section on the manufacturer's website: www.goodram.com.
